                                                                                                                                                                                                                                                                                                                                                                                                                                                      neuroexocytosis apparatus, synaptobravins, SNAP25 or s detected action on small molecule substrates. SUBUNIT: Disulfide-linked heterodimer of a light chain heavy chain (H) (By similarity). SUBCELLULAR LOCATION: Secreted. MISCELLANEOUS: There are seven antigenically distinct bottlinum neurotoxin: Types A, B, Cl, D, E, F, and G. SIMILARITY: BELONGS TO PEPTIDASE FAMILY M27.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 e encoding the nontoxic nonhemagglutinin component.";

J. Syst. Bacteriol. 46:1105-1112(1996).

FUNCTION: Inhibits acetylcholine release. The botulinum toxin binds with high affinity to peripheral neuronal presynaptic membrane, is then internalized by receptor-mediated endocytosis. The C-terminus of the heavy chain (H) is responsible for the adherence of the toxin to the cell surface while the N-terminus mediates transport of the light chain from the endocytic vesicle to the cytosol. After translocation, the light chain (L) hydrolyzes the 197-Gln-|-Arg-198 bond in SNAP-25, thereby blocking neurotransmitter release. Inhibition of acetylcholine release results in flaccid paralysis, with frequent heart or respiratory
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    failure (By similarity).

IT BINDS TO PERLPHERAL NEURONAL SYMAPSES, IS INTERNALIZED AND MOVES BY RETROGRADE TRANSPORT UP THE AXON INTO THE SPINAL CORD WHERE IT CAN MOVE BETWEEN POSTSYNAPTIC AND PRESYNAPTIC NEURONS. IT INHIBITS NEUROTRANSMITTER RELEASE BY ACTING AS A ZINC ENDOPERTIDASE THAT CLEAVES THE 76-GLM-I-PHE-77 BOND OF SYMAPTORREVIN-2.

-I- CATALYTIC ACTIVITY: Limited hydrolysis of proteins of the neuroexocytosis apparatus, symaptobravins, SNAP25 or syntaxin. No detected action on small molecule substrates.
-I- SUBUNIT: DISULFIDE-LINED HYTEROIMER OF A LIGHT CHAIN (L) AND A HEAVY CHAIN (H). THE LIGHT CHAIN HAS THE PHARMACOLOGICAL ACTIVITY, WHILE THE N-AND C-TERMINAL OF THE HEAVY CHAIN MEDIATE CHANNEL FORMATION AND TOXIN BINDING, RESPECTIVELY.
-I- MISCELLULAR LOCATION: Secreted.
-I- MISCELLULAR LOCATION: SECRETIVE A, B, Cl, D, E, F, AND G.

                                                                                                                                                                                                                                                    Struct. Biol. 5:898-902(1998).

FUNCTION: Inhibits acetylcholine release. The botulinum toxin binds with high affinity to peripheral neuronal presynaptic membrane, is then internalized by receptor-mediated endocytosis. The C-terminus of the heavy chain (H) is responsible for the adherence of the toxin to the cell surface while the N-terminus mediates transport of the light chain from the endocytic vesicle to the cytosol. After translocation, the light chain (L) hydrolyzes the 197-Gln-|-Arg-198 bond in SNAP-25, thereby blocking neurotransmitter release. Inhibition of acetylcholine release results in flaccid paralysis, with frequent heart or respiratory
           heavy chain (H).

                                                                                                                                                                                        FUNCTION: Involved in regulation of L3 expression and stability and plays a role in early 60S ribosomal subunit assembly. May be required for proper assembly of preribosomal particles during early ribosome biogenesis, presumably by targeting L3 onto the 35S

                                                                                                                                                                                                                                                              FUNCTION: P3C POLYPEPTIDE IS A PROTEASE THAT CLEAVES AT CERTAIN Q/G SITES IN THE POLYPROTEIN. IT MAY BE A CYSTEINE PROTEASE. SUBUNIT: THE VIRUS CAPSID IS COMPOSED OF 60 ICOSAHEDRAL UNITS, SUBUNIT: THE VIRUS CAPSID IS COMPOSED OF PROTEINS VP1, VP2, EACH OF WHICH IS COMPOSED OF ONE COPY EACH OF PROTEINS VP1, VP2, VP3, AND VP4.

PTM: SPECIFIC ENZYMATIC CLEAVAGES IN VIVO YIELD MATURE PROTEINS SIMILARITY: THE PROTEASE BELONGS TO PEPTIDASE FAMILY C3.

                                A polypeptide (AAW09014) comprises the heavy chain (amino acids 848-1278) of a type F botulinum neurotoxin (BONT/F), and can be produced using a synthetic gene (AAT48101) based on the natural gene sequence (AAT48100) for the heavy chain. The polypeptides and its fragments (see also AAW09015-17) lack the light chain and HN epitopes necessary for metalloprotease activity and toxin internalisation. They are free of botulinum toxin activity but can induce protective immunity to a type F botulinum toxin, making them useful for vaccine prodn. Recombinant polypeptides can be
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  848-1278, 848-991, 992-1135 and 1136-1278 in the heavy chain type F botulinum neurotoxin (BoNT/F). They lack the L chain HN epitopes necessary for metalloprotease activity and toxin internalisation. They are free of botulinum toxin activity I induce protective immunity to a type F botulinum toxin, makin useful for vaccine prodn. Recombinant polypeptides can be produced in transformed host cells, esp. as fusion proteins, with maltose binding protein to facilitate purification.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Clostridium botulinum

a Venezuelan equine encephalitis virus (VEE) replicon vector. Use of this vector results in the production of large amounts of a protein encoded by a sequence cloned into the replicon. The constructs are used to produce vaccines against botulism. The proteins can also be used as diagnostic tools for the diagnosis of botulism. The transformed host cells can be used to analyse the effectiveness of drugs and agents which
                                                                                                                  The invention relates to novel vaccines that induce a protective immune response against botulinum neurotoxin (BoNT) serotypes A, B, C, D, E, F and G (BoNTA-BoNTG). The vaccine of the invention is novel recombinant DNA construct comprising a vector, and at least one nucleic acid fragment comprising a C-terminal heavy chain fragment (Hc) from BoNT serotypes A-G. In preferred embodiments of the invention, the vector is a Venezuelan equine encephalitis virus (VEE) replicon vector. Use of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Botulinum neurotoxin; heavy chain; BoNT; serotype F; C-terminal fragment; Venezuelan equine encephalitis VEE; botulism; vaccine; diagnosis; drug screening.
                                                                                                                                                                                                                                                                                                                                                              toxin serotypes

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        inhibit toxin effects. The vaccine currently used against botulism is dangerous and expensive to produce, and contains formalln, which is very painful for the recipient. Also, the vaccine is incomplete, in that only 5 of the 7 serotypes are represented in the formulation. The novel vaccine of overcomes these problems, as it is easily purified, and available in large quantities. It is also expressed in the lymph nodes for a better immune response. Sequences AAV77139 represent synthetic BONT Hc fragments used in the present invention. The DNA encoding these sequences had been optimised for codon usage for expression in yeast. Note: This sequence is not given in the specification, but is decoded from the BONTF Hc DNA sequence given on pages 45-46.

The nucleic acids are expressible in a recombinant organisms such as Escherichia coll or Pichlia pastoris. The use of recombinant nucleic acids are advantageous since it eliminates the need to culture large quantities of hazardous toxin producing bacterium. Production yield from the genetically engineered product is also high and cost of production is lower. The nucleic acids can
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Bottlism neurotoxins are translated as a single 150 kDa polypeptide chain and then posttranslationally nicked, forming a dichain which consisting of a 100 kDa heavy chain and a 50 kDa light chain which remain linked by a disulfide bond. Nucleic acids encoding the carboxy-terminal (HC) or amino-terminal (HN) portion of the heavy chain of botulinum neurotoxin (BNT) can be used in recombinant chain of botulinum neurotoxin (BNT) can be used in recombinant

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               밁
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Botulism neurotoxins are translated as a single 150 kDa polypeptide C chain and then posttranslationally nicked, forming a dichain C consisting of a 100 kDa heavy chain and a 50 kDa light chain which C consisting of a 100 kDa heavy chain and a 50 kDa light chain which C cremain linked by a disulfide bond. Nucleic acids encoding the C carboxy-terminal (HC) or amino-terminal (HN) portion of the heavy C chain of botulinum neurotoxin (BoNT) can be used in recombinant C expression vectors and expressed in transformed cells to produce C peptide antigens useful for eliciting an immune response to give C protective immunity against botulinum neurotoxin, which causes C botulism. The nucleic acids are expressible in a recombinant C organisms such as Escherichia coli or pichia pastoris. The use C of recombinant nucleic acids are advantageous since it eliminates C the need to culture large quantities of hazardous toxin-producting C bacterium. Production yield from the genetically engineered product C is also high and cost of production is lower. The nucleic acids can be derived from Clostridium botulinum serotypes A-G.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Matches

```
The invention relates to a non toxic polypeptide, for delivery of a CC therapeutic agent to a neuronal cell, which comprises a binding domain CC (carboxy terminal half of heavy chain (HC) of a neurotoxin, designated CC as HC) that binds to the neuronal cell and a translocation domain (amino terminal half of HC, designated as HN), that translocation domain (amino CC agent into the neuronal cell, where the translocation domain is not a HN CC domain of a clostridial neurotoxin and is not a fragment or derivative of CC a HN domain of a clostridial toxin. Polypeptides of the invention are CC useful for the treatment of a disease state associated with neuronal CC cells. The polypeptide constructs are useful for delivering therapeutic CC substances to neuronal cells. They are useful to treat disorders of the CC constluding neurodegenerative diseases, stroke, epilepsy, brain tumours CC and infection. They are also useful in gene therapy. The present sequence is modified clostridial heavy chain fragment. This sequence is CC constructed by fusing the binding domain of botulinum neurotoxin type F CC (BONT/F) with translocation domain of diphtheria neurotoxin.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           New non toxic polypeptide for delivery of a therapeutic agent treatment of a CNS disorder comprising a binding domain that translocates the therapeutic agent into the neuronal cells - \frac{1}{2}
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         07-APR-2000; 2000GB-0008658

Modified clostridial heavy chain-superoxide dismutase conjugate 01-NOV-2001 (first entry)

#5

Chimeric - Bacillus stearothermophilus. Chimeric - Influenza virus. Chimeric - Clostridium botulinum. Chimeric - Synthetic. superoxide dismutase; tumour; Neuronal cell; binding domain; translocation domain; stroke; epilepsy; infection; neurodegenerative SOD; botulinum neurotoxin type F; BONT

WO200158936-A2

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The invention relates to a non toxic polypeptide, for delivery of a CC therapeutic agent to a neuronal cell, which comprises a binding domain CC (carboxy terminal half of heavy chain (HC) of a neurotoxin, designated cas HO) that binds to the neuronal cell and a translocation domain (amino terminal half of HC, designated as HN), that translocation domain (amino terminal half of HC, designated as HN), that translocation domain so to a HN comman of a clostridial neurotoxin and is not a fragment or derivative of comman of a clostridial neurotoxin and is not a fragment or derivative of the invention are comman of a clostridial toxin. Polypeptides of the invention are compared to the treatment of a disease state associated with neuronal colls. The polypeptide constructs are useful for delivering therapeutic combinates to neuronal cells. They are useful for delivering therapeutic combines to neuronal cells. They are useful to treat disorders of the committee conception. They are also useful in gene therapy. The present sequence is modified clostridial heavy chain-superoxide dismutase conjugate. This conjugate comprises bacterial Mn superoxide dismutase conjugate. This conjugate comprises bacterial Mn superoxide dismutase (MnSOD) from translocation peptide from influenza virus and a neuronal cell-specific binding domain from botulinum neurotoxin type F (BoNT/F).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Query Match

The invention relates to a non toxic polypeptide, for delivery of a CC therapeutic agent to a neuronal cell, which comprises a binding domain CC (carboxy terminal half of heavy chain (HC) of a neurotoxin, designated CC as HC) that binds to the neuronal cell and a translocation domain (amino terminal half of HC, designated as HN), that translocation domain (amino terminal half of HC, designated as HN), that translocation domain is not a HN commain is not a HN commain is not a HN commain of a clostridial neurotoxin and is not a fragment or derivative of CC domain of a clostridial toxin. Polypeptides of the invention are useful for the treatment of a disease state associated with neuronal CC cells. The polypeptide constructs are useful for delivering therapeutic cubstrances to neuronal cells. They are useful to treat disorders of the CC substances to neuronal cells. They are useful to treat disorders of the CC is including neurodegenerative diseases, stroke, epilepsy, brain tumours and infection. They are also useful in gene therapy. The present sequence is modified clostridial heavy chain-superoxide dismutase (MnSOD), from CC many contained the comprises bacterial Mn-superoxide dismutase (MnSOD), from CC This conjugate comprises bacterial Mn-superoxide dismutase (MnSOD), from CC specific binding domain from diphtheria neurotoxin and a neuronal cell-specific specific binding domain from botulinum neurotoxin type F (BoNT/F).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Matches 144;

                                                                                                                                                                                                                                                                                                 CC The invention relates to a non toxic polypeptide, for delivery of a CC therapeutic agent to a neuronal cell, which comprises a binding domain CC (carboxy terminal half of heavy chain (HC) of a neurotoxin, designated CC as HC) that binds to the neuronal cell and a translocation domain (amino CC terminal half of HC, designated as HN), that translocation domain (amino CC agent into the neuronal cell, where the translocation domain is not a HN CC domain of a clostridial neurotoxin and is not a fragment or derivative of CC a HN domain of a clostridial toxin. Polypeptides of the invention are CC useful for the treatment of a disease state associated with neuronal CC cells. The polypeptide constructs are useful for delivering therapeutic substances to neuronal cells. They are useful to treat disorders of the CC substances to neuronal cells. They are useful to treat disorders of the CC indication. They are also useful in gene therapy. The present sequence is modified clostridial heavy chain-superoxide dismutase conjugate. CC inker that can be cleaved by thrombin, translocation domain from CC diphtheria neurotoxin and a neuronal cell-specific binding domain from CC diphtheria neurotoxin type F (BONT/F).

                                                                                                                           ρy
                                                                                                                                                                                                                                      The invention relates to a non toxic polypeptide, for delivery of a CC therapeutic agent to a neuronal cell, which comprises a binding domain CC (carboxy terminal half of heavy chain (HC) of a neurotoxin, designated CC as HC) that binds to the neuronal cell and a translocation domain (amino CC terminal half of HC, designated as HN), that translocates the therapeutic CC agent into the neuronal cell, where the translocation domain is not a HN CC domain of a clostridial neurotoxin and is not a fragment or derivative of CC as HN domain of a clostridial toxin. Polypeptides of the invention are CC useful for the treatment of a disease state associated with neuronal CC cells. The polypeptide constructs are useful for delivering therapeutic CC substances to neuronal cells. They are useful to treat disorders of the CC CNS including neurodegenerative diseases, stroke, epilepsy, brain tumours CC and infection. They are also useful in gene therapy. The present sequence is C. botulinum C2 enterotoxin translocation domain with botulinum CC neurotoxin type F (BONT/F) binding domain used in the exemplification of

                                                                                                                                                                                                                                                                                       The present sequence represents a construct of the invention, comprising a manganese superoxide dismutase (Mn-SOD) polypeptide, a linker that can be cleaved by thrombin, and a heavy chain derived from botulinum neurotoxin serotype F. The specification describes a composition for delivery of SOD to neuronal cells. The composition comprises SOD linked, by a cleavable linker, to a neuronal cell targeting component (NCTC). This component has a domain that binds to a neuronal cell and a domain that translocates the SOD of the composition into the neuronal cell. After translocates the SOD of the composition into the neuronal cell. After translocation, the linker is cleaved to release the SOD. The composition is useful for treating neuronal diseases caused or augmented by oxidative stress, such as ischemic stroke, trauma, Parkinson's disease, Huntington's disease and motor neurone diseases.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Manganese superoxide dismutase; Mn-SOD; SOD; neuronal cell; neuronal cell targeting component; NCTC; neuronal disease; oxidative stress; ischemic stroke; trauma; Parkinson's disease; Huntington's disease; motor neurone disease;

The specification describes a composition for delivery of SOD to neuronal cells. The composition comprises SOD linked, by a cleavable linker, to a neuronal cell targeting component (NCTC). This component has a domain that binds to a neuronal cell and a domain that translocates the SOD of the composition into the neuronal cell. After translocation, the linker is cleaved to release the SOD. The composition is useful for treating neuronal diseases caused or augmented by oxidative stress, such as schemic stroke, trauma, Parkinson's disease, Huntington's disease and motor neurone diseases.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Novel composition, comprising superoxide dismutase linked by a cleavable linker to a neuronal cell targeting component useful for delivering superoxide dismutase to neuronal cells to treat ischemia
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           neuronal cell targeting component; NCTC; neuronal disease; oxidative stress; ischemic stroke; trauma; Parkinson's disease; Huntington's disease; motor neurone disease; botulinum neurotoxin serotype F.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      AAY93312 standard; protein; 1084 AA

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The invention relates to a non toxic polypeptide, for delivery of a therapeutic agent to a neuronal cell, which comprises a binding domain (carboxy terminal half of heavy chain (HC) of a neurotoxin, designated as HC) that binds to the neuronal cell and a translocation domain (amino terminal half of HC, designated as HN), that translocates the therapeutic agent into the neuronal cell, where the translocation domain is not a HN domain of a clostridial neurotoxin and is not a fragment or derivative of a HN domain of a clostridial toxin. Polypeptides of the invention are useful for the treatment of a disease state associated with neuronal cells. The polypeptide constructs are useful for delivering therapeutic substances to neuronal cells. They are useful to treat disorders of the constructs are useful to treat disorders of the substances to neuronal cells. They are useful to treat disorders of the constructs are useful to treat the

                                                                                                                                                                                                                                            CC The invention relates to a non toxic polypeptide, for delivery of a CC therapeutic agent to a neuronal cell, which comprises a binding domain CC (carboxy terminal half of heavy chain (HC) of a neurotoxin, designated CC as Hc) that binds to the neuronal cell and a translocation domain (amino CC terminal half of HC, designated as HN), that translocation domain is not a HN CC domain of a clostridial neurotoxin and is not a fragment or derivative of CC a HN domain of a clostridial toxin. Polypeptides of the invention are CC useful for the treatment of a disease state associated with neuronal CC cells. The polypeptide constructs are useful for delivering therapeutic CC substances to neuronal cells. They are useful to treat disorders of the CC and infection. They are also useful in gene therapy. The present sequence is modified clostridial heavy chain fragment. This sequence is constructed by fusing the binding domain which is a hybrid of botulinum neurotoxin type F (BONT/F) and tetanus neurotoxin (TeNT) domain II with
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Дb
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Ş

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                δÃ
                                                                                                                                                        This is the amino acid sequence of the histidine-tagged C fragment of Clostridium botulinum (202F strain) type F neurotoxin, encoded by a DNA sequence (see AAV3053) in plasmid pEFHisb. This vector can be used to express BotC soluble C fragment in Escherichia coll host cells, with the recombinant C fragment proteins that an affinity column. The invention relates to recombinant proteins derived from C. botulinum toxins, especially type B and type E toxins. Methods are provided which allow for the isolation of soluble recombinant proteins free of significant endotoxin cointamination. Preferred hosts for production of recombinant proteins are E. coll, insect cells and yeast cells. The recombinant toxins are used as immunogens for the production of and animals at risk of intoxication with clostridial toxin.

FUNCTION: BOTULINUS TOXIN ACTS BY INHIBITING NEUROTRANSMITTER FUNCTION: BOTULINUS TOXIN ACTS BY INHIBITING NEUROTRANSMITTER RELEASE. IT BINDS TO PERIPHERAL NEURONAL SYNAPSES, IS INTERNALIZED AND MOVES BY RETROGRADE TRANSPORT UP THE AXON INTO THE SPINAL CORD WHERE IT CAN MOVE BETWEEN POSTSYNAPTIC AND PRESYNAPTIC NEURONS. IT INHIBITS NEUROTRANSMITTER RELEASE BY ACTING AS A ZINC ENDOPEPTIDASE THAT CATALYZES THE HYDROLYSIS OF THE 180-ARG-[-ILE-ENDOPEPTIDASE THAT CATALYZES THE HYDROLYSIS OF THE 180-ARG-[-ILE-ENDOPERTICALYZES]

No detected action on small molecule substrates.
-!- SUBUNIT: DISULFIDE LINKED HETERODIMER OF A LIGHT CHAIN (L) AND A HEAVY CHAIN (H). THE LIGHT CHAIN HAS THE PHARMACOLOGICAL ACTIVITY, WHILE THE N-AND C-TERMINAL OF THE HEAVY CHAIN MEDIATE CHANNEL FORMATION AND TOXIN BINDING, RESPECTIVELY.
-!- SUBCELLAUROUS: THERE ARE SEVEN ANTIGENICALLY DISTINCT FORMS OF BOTULTHUM NEUROTOXIN: TYPES A, B, Cl, D, E, F, AND G.
-!- SIMILARITY: BELONGS TO PEPTIDASE FAMILY M27.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Gimenez J., Foley J., Dasgupta B.R.;

"Neurotoxin type E from Clostridium botulinum and C. butyricum;

partial sequence and comparison.";

PASSEB J. 2:A1750-A1750(1988).

-!- EUNCTION: BOTULINUS TOXIN ACTS BY INHIBITING NEUROTRANSMITTER

RELEASE. IT BINDS TO PERIPHERAL NEURONAL SYNAPSES, IS INTERNALIZED

AND MOVES BY RETROGRADE TRANSPORT UP THE AXON INTO THE SPINAL CORD

WHERE IT CAN MOVE BETWEED POSTSYNAPTIC AND PRESYNAPTIC NEURONS. IT

INHIBITS NEUROTRANSMITTER RELEASE BY ACTING AS A ZINC
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 InterPro; IPR000395; Bontoxilysin.
